

SmartStream RDU launches SFTR security reference data service

Written by [Sharon Kimathi](#) 12th September 2019

The SmartStream reference data utility (RDU) has launched a cloud-based security reference data service to simplify and enable firms to meet the European Union's Securities Financing Transactions Regulation (SFTR) requirements.

Gathering data required to complete SFTR reports could well prove a headache for most firms when the reporting obligations begin next year. The SFTR requires banks and investment firms to start reporting securities financing transactions (SFT) to a registered trade repository beginning 14 April 2020. Each transaction report must include the details of the transaction, the counterparties and the specifics of the security involved, and many firms are now focused on preparing for that date.

The SmartStream RDU acquires instrument reference data from a broad range of industry sources. It then normalises, enriches and maps this information into the format required by SFTR and makes it available via a simple, cloud-based API. Data is updated daily, and five years of history is retained and accessible for back-loading, corrections and effective audit controls.

Peter Moss, CEO, SmartStream RDU, comments: "Although ESMA's reporting guidelines have yet to be fully finalised, proactive firms will now be planning carefully how best to meet SFTR reporting obligations. SFTR transaction reports are complex and most firms have been focusing on capturing the details of the transaction, creating a UTI and ensuring that they have the necessary counterparty details already."

Moss aims to remove the complexity from sourcing high-quality reference data and enabling firms to focus on managing their business.
